

LKA Invoices

Managing users & admin accounts · Firebase clean-up · Portal limits

Lingeshwar Kaparathi & Associates · Live app: lingeshwarca-invoice.netlify.app · Firebase project: ca-invoice-app · Prepared October 2026

1. Access levels: who can do what

Every person has a **role** (ADMIN or STAFF) and two **permissions** that an owner switches on or off in **Settings** → **Users**:

- **Revenue & reports**: revenue totals on Home, the Reports page, CSV export, monthly goal and Backup. ADMINS only.
- **Payments, receipts & statements**: record payments, see payment details, receipts and client statements.

The firm uses three access levels:

What they can do	Admin A Owner	Admin B Admin, no revenue	Staff
Role · Revenue · Payments	ADMIN · On · On	ADMIN · Off · Off	STAFF · Off · On
Home & work			
Sign in; Home with tasks, events, notes, links, overdue and unpaid counts, nudges, recent activity	Yes	Yes	Yes
Revenue on Home: ₹ month / year tiles, 6-month chart, monthly goal ring, weekly ₹ totals, ₹ milestones	Yes	No	No
Reports page (billed vs received, collection rate, ageing, top clients, who owes)	Yes	No	No
Invoices			
See invoice list and each invoice (including its amount); search; notification bell	Yes	Yes	Yes
Create / edit drafts, issue invoices, duplicate	Yes	Yes	Yes
View / download PDF; send by email or WhatsApp; payment reminders	Yes	Yes	Yes
Record payments (mark as paid)	Yes	No	Yes
See payment details on an invoice; download / send receipts	Yes	No	Yes
Export invoices to CSV	Yes	No	No
Cancel numbered invoices	Yes	Yes	No
Delete invoices (one, or "Delete all")	Yes	Yes	No
Clients			
Add and edit clients, tags and internal notes	Yes	Yes	Yes
Client statements (billed / received / balance PDF)	Yes	No	Yes
Delete clients; import clients from CSV	Yes	Yes	No
Settings & admin			
Firm details, bank / UPI, GST, services, signature, branding, message templates	Yes	Yes	No
Monthly collection goal	Yes	No	No
Restart invoice numbering at 0001; Activity log	Yes	Yes	No
Invite users, change roles, disable / enable / delete users	Yes	Yes, not owners	No
Turn "Revenue & reports" / "Payments, receipts & statements" on or off for others	Yes	No	No
Backup download (contains all data, including revenue)	Yes	No	No

How it is enforced: recording payments, deleting and changing access are checked by the database rules and server functions, not just hidden in the browser. Revenue *totals* are hidden from the screens. Admin B and Staff can still see each invoice's own amount (needed to create and send invoices), so this keeps totals need-to-know rather than secret.

1.1 Setting up the three levels

1. **Admin A (owner).** The first admin (set up with the setup code) is an owner. **Accounts that were admins before this update are owners automatically.** Owners show the badge "*Owner · full access*" in Settings → Users.
2. **Admin B.** Settings → Users → Give someone access → enter their Google email, choose the access level **Admin · no revenue, no payments** → Give access. They get it at first sign-in; nothing else to do.
3. **Staff.** Same, but choose **Staff · with payments** (payments, receipts and statements on).
4. **Adjusting.** As an owner, use the two switches under each person in Settings → Users. They are signed out and get the new access when they sign in again. Turning on "Revenue & reports" makes that admin an owner, so only do it for people who should see everything.

Check after updating: if you added a second admin *before* this update, they are also an owner now. Open Settings → Users and switch off "Revenue & reports" and "Payments, receipts & statements" for them to make them Admin B. Keep at least **two owners** if possible (or one owner plus a safe way back: section 4). Admin B cannot change, disable or delete an owner.

2. Managing users inside the portal (recommended)

Everything is in **Settings** → **Users** (visible to ADMINS only). The portal method is preferred because it cleans up everything in one click.

2.1 Give someone access

1. Under **Give someone access**, type the person's **Google email** (Gmail or Google Workspace address).
2. Choose the **Access level** and click **Give access**. Owners can pick any of: *Owner · full access*, *Admin · no revenue*, *Admin · no revenue, no payments*, *Staff · with payments*, *Staff · no payments*. Admins who are not owners can only pick *Admin · no revenue, no payments* or *Staff · with payments*.
3. They appear under **Waiting to sign in**.
4. Send them the site link. They click **Sign in with Google** using that same email, and they are let in automatically.
5. They then move to **People with access**, which shows "Active now" or when they were last active.

To cancel an invite before it is used, click **Remove** next to the email under *Waiting to sign in*.

2.2 Change someone's role

1. Find the person under **People with access**.
2. Click **Make ADMIN** or **Make STAFF** and confirm. A role change never gives revenue access; an owner switches that on separately.
3. They are signed out and get the new role when they sign in again.

2.3 Block someone temporarily

For leave, a lost phone or a suspected misuse:

1. Click **Disable** on their row and confirm. They are signed out at once and cannot sign in.
2. To restore access, click **Enable**. Nothing is lost.

2.4 Delete someone permanently

For example, when a person leaves the firm:

1. Click **Delete** on their row.
2. Type **DELETE** in the box and click **Delete user**.

This removes:

- their sign-in account and access
- any pending invite
- their private tasks, events, notes and links

Invoices and clients they created are kept. To give them access again later, add their email again as in 2.1.

3. Managing users in the Firebase console (backup method)

Use this only if the portal is not available, or to double-check. Open <https://console.firebase.google.com> and select the project **ca-invoice-app**.

3.1 Find a user

1. In the left menu, open **Build** → **Authentication** → **Users**.
2. Each row shows:
 - the email
 - the sign-in method (Google or email)
 - the **User UID**, a long code you will need below

3.2 Disable a user (temporary)

1. Click  at the end of the user's row, then **Disable account**.
2. To undo, use **Enable account** from the same menu.
3. Also click **Disable** in the portal, so the Users page shows the correct status.

3.3 Delete a user completely: do all four steps

1. **Authentication** → **Users**:
 - Note the person's **User UID**.
 - Click , then **Delete account**, and confirm. They can no longer sign in.
2. **Build** → **Firestore Database** → **Data**:
 - Open the `users` collection and find the document whose name equals that UID.
 - Use the  menu at the top of the document to choose **Delete document**.
 - Without this step, they still appear on the portal's Users page.
3. In the `invites` collection, if a document named with their email exists, delete it. Otherwise they could sign in again and regain access.
4. Optional: in the `tasks`, `events`, `notes` and `links` collections, delete documents whose `ownerUid` equals that UID.

3.4 What the console cannot do

- **Change roles.** ADMIN / STAFF is stored in a protected place the console does not show. Change roles only in the portal (2.2).
- **Give access by itself.** If someone signs in with Google without being on the Users list, Firebase creates a sign-in account for them. They only see "No access yet", and these stray accounts are safe to delete in Authentication.

Never delete these Firestore collections or documents in the console:

- `counters` : invoice numbering
- `settings` : firm details
- `system` : setup lock
- `auditLog` : invoice history

Delete invoices only in the portal (Invoices page), so the history log records it.

4. If all admin access is lost

1. In Netlify, open **Site configuration** → **Environment variables**:
 - Add `SETUP_CODE` with a new secret of 12 or more characters.
 - Go to **Deploys** → **Trigger deploy** → **Deploy site**.
2. In the Firebase console, open **Firestore Database** → **Data** → **system** and delete the document **bootstrap**.
3. Sign in to the portal with Google. On the "No access yet" screen, enter the setup code. You become ADMIN.
4. Delete `SETUP_CODE` from Netlify again and redeploy.

Step 3 works only when **no** admin exists at all. If an admin account still exists but nobody can use it, first delete that account as described in 3.3. Keeping two admins avoids this situation entirely.

5. Good practice checklist

- Delete `SETUP_CODE` from Netlify once the first admin is set up, then redeploy.
- Keep two ADMIN accounts.
- Delete users who leave the firm on their last day (2.4). Use Disable for temporary blocks.
- Once a month, take a backup in **Settings** → **Backup** and keep the file safe (Google Drive or a USB drive). The free Firebase plan has no automatic backups.
- Sign out on shared computers. The portal also signs you out automatically after 30 minutes of inactivity.

- Share only invoice PDFs with clients, never the portal link or your login.

6. Limits for clients and invoices

The portal has no fixed limit on how many clients or invoices it stores. The practical limits come from the invoice number format and Firebase's free (Spark) plan.

Limit	Value	What it means
Invoices per financial year	9,999	Numbers have 4 digits (LKA/2026-27/0001 to 9999) and restart every 1 April. That is about 27 invoices a day, every day.
Clients	No app limit	Tens of thousands would still fit.
Service lines per invoice	50	Plus up to 30 reimbursement lines.
Services in the Settings list	100	Each with an optional default price.
Total storage (free plan)	1 GB	One invoice with its history is about 5 KB, so roughly 150,000–200,000 invoices in total: decades of use for a small firm.
Reads per day (free plan)	50,000	Opening the invoice list uses about 25 reads; a busy day uses a few hundred to a couple of thousand.
Writes per day (free plan)	20,000	Creating and issuing an invoice uses about 4–6 writes.
Deletes per day (free plan)	20,000	Matters only for very large "Delete all" actions.

If a daily limit is reached:

- The portal shows an error until the limit resets, at about **1:30 pm IST** each day.
- **There are never any charges.** The free plan simply pauses; it does not bill you, and no card is needed.
- With normal use you will not come close. Only very large one-off jobs could reach a limit, such as a backup or CSV export of thousands of invoices.
- You can check usage in the Firebase console under **Firestore Database** → **Usage**.
